ENERGY SECTOR BRIEF — US PUBLIC EV CHARGING MARKET REPORT

36.99billion

U.S. EV charging market by 2033

The U.S. EV charging infrastructure market is set for rapid expansion, but long-term winners will be operators that convert policy support and network buildout into higher utilization and sustainable profitability.

Tesla commands nearly 40% of new EV charger deployments as the U.S. market accelerates 6× toward \$37 billion by 2033

01 Market Size and Growth

The U.S. EV charging infrastructure market is tracking from about \$5.92 billion in 2025 to roughly \$7.5 billion in 2026 and is projected to reach about \$36.99 billion by 2033, implying a 2026–2033 CAGR of 25.7%.¹ Public charging footprint also continues to scale, with third-party census data showing 312,486 public ports counted through June 30, 2026, while DOE-linked registries show roughly 290,000–250,000+ public ports depending on update timing and counting method.²³⁴ Fast charging remains the growth engine: Paren estimates 141 million U.S. public fast-charging sessions in 2025, up about 30% year over year, alongside roughly 18,000 new DC fast ports added in 2025.⁵⁶

Title — Projected Growth of the U.S. Fast-Charging Market

METRIC	VALUE
U.S. market revenue, 2025	\$5.92B
U.S. market revenue, 2026	~\$7.5B
U.S. market revenue, 2033	~\$36.99B
CAGR, 2026–2033	25.7%
Public fast-charging sessions, 2025	141M
Public ports, mid-2026	312,486

U.S. EV Charging Market Revenue (USD Billions)

Supporting Metrics

02 Competitive Landscape

The market remains fragmented, with DOE's charging-network registry listing well over 120 operators and service providers, but scale is still concentrated in a handful of national brands.⁷ Tesla remained the clear deployment leader in 2025, adding 6,786 Supercharger ports and accounting for 37.6% of all new U.S. public fast-charging deployments that year; Paren says Tesla added more ports than the next nine operators combined.⁵ The next tier includes EVgo, Electrify America, ChargePoint, and the rapidly emerging Ionna network, which GM said had already reached 120+ locations nationwide by July 2026, while Q2 2026 market tracking also showed Walmart and other nontraditional hosts accelerating deployments.^{8,9} The near-term takeaway is a market that is still structurally fragmented, but with Tesla retaining a decisive lead in throughput, brand trust, and deployment velocity.⁵

03 Policy and Regulatory Environment

Federal support remains large on paper: the IIJA/BIL created a \$7.5 billion national EV charging buildout framework, including nearly \$5 billion for NEVI and \$2.5 billion for CFI, with additional support mechanisms layered through the IRA and related federal programs.^{10,11} Deployment has lagged appropriations, however; GAO reported that only 384 NEVI- and CFI-funded chargers were open to the public as of April 2025 and warned that federal agencies lacked strong enough performance management to track outcomes effectively.¹² The regulatory backdrop has also turned less supportive in 2026, with EPA finalizing rescission of the 2009 Endangerment Finding and related vehicle GHG standards, while California waiver and ACC-

related rules have been pushed back into congressional and federal review.^{13 14} For operators and investors, the headline is a widening gap between still-material public funding availability and a more uncertain federal-state regulatory trajectory.^{10 12}

04 Profitability and Business Model Challenges

Profitability remains the sector's central challenge because utilization is still uneven and networks carry high fixed costs across hardware, interconnection, maintenance, software, and customer support, even as session growth is improving asset productivity.^{5 15} Public-company disclosures show the pressure clearly: ChargePoint was still reporting an adjusted EBITDA loss in fiscal 2026, while EVgo continues to frame late 2026 as the start of a profitability inflection rather than a completed transition.^{16 17} The operating levers are increasingly clear—higher utilization, better uptime, easier payments, and lower service-call intensity—while monetization is broadening beyond charging fees into software, fleet services, advertising, and grid or energy-management services.^{16 18} For industry professionals, the practical read-through is that scale alone is not enough; reliability and customer experience are becoming the main route to EBITDA durability.^{5 17}

05 Long-Term Outlook

The long-range buildout case remains positive despite policy volatility: Wood Mackenzie expects the U.S. public DC fast-charging segment to grow at a 14% CAGR through 2040, reaching about 475,000 ports and roughly \$3.3 billion in annual market value.^{19 20} That outlook assumes utilization improves enough for profitability to emerge by the middle of the next decade, but execution risk remains tied to grid interconnection delays, capital discipline, and whether public funding offsets a tougher emissions-policy environment.^{12 13 19} Consumer adoption is still a gating factor because charging confidence remains uneven; while the exact share varies by survey, range anxiety and charging access continue to rank among the top barriers to EV adoption in U.S. market research.^{2 19} Net-net, the market still points to structural expansion, but the winners are likely to be operators that can combine policy capture, grid-ready siting, and consistently reliable high-utilization assets.¹⁹

KEY TAKEAWAYS

- The U.S. EV charging infrastructure market is set for rapid expansion, but long-term winners will be operators that convert policy support and network buildout into higher utilization and sustainable profitability.
- Fast charging is the key growth engine, with 141 million public fast-charging sessions projected in 2025 and 18,000 new DC ports added.
- The market remains fragmented across 120+ operators, yet Tesla led 37.6% of new U.S. public fast-charging deployments in 2025.
